Principle: Your brain is impressive, and it is also a narrative machine with bugs.

Humility is not self-hatred. Humility is accurate self-knowledge: you have blind spots, like everyone. What Your Brain Naturally Does Your mind: - prefers stories to statistics, - notices evidence that supports what you already believe, - protects your identity, - and confuses confidence with correctness.

That's not a moral failure. It's a human baseline. The Failure Mode: Ego Turns "I Might Be Wrong" Into "I Must Be Right" When you're defending your identity, you stop learning. Certainty feels good. It also shuts down curiosity fast.

Warning signs: - You interrupt to correct. - You hunt for "gotchas." - You feel relief when someone else looks stupid. - You argue like it's war. The Two Tools 1) Say the phrase: "I could be wrong." 2) Ask the question: "What would change my mind?"

If the answer is "nothing," you're not reasoning. You're performing. How To Disagree Like A Grownup - Steelman before you criticize: state their view better than they did. - Ask for their strongest source, not their weakest example. - Admit the best counterpoint you've heard. - Separate the claim from the person. The Practice (This Week) - Say "I could be wrong" once per day, out loud. - Replace one hot take with a real question. - When you feel the urge to dunk, choose to understand. Reflection (Optional) What belief do you defend mostly because it's yours? Related Hymn Hymn IV - No One's the Smartest Ape in the Room
